Density of pure gold can range from 7.9 gm/cm³ to 20 gm/cm³ depending on the method of recovery. Pure gold can be obtained by crushing alloys with a high proportion of gold. It can also be separated from pyrite by roasting it. In general, pure gold prices are higher than the prices of some other metals, such as copper. 10 to 8 gm/cm³ compared with the 0.5 to 1 gm/cm³ for bulk iron ore. Although these facts are generally acknowledged, many feel that there is not enough gold left in the world to satisfy current worldwide demand. Gold prices have in fact increased by a factor of ten in only the last 30 years. In the early 1900s, the price of gold was around \$15.00 per troy ounce. This price has quadrupled in recent years. The fundamental reason for this unprecedented increase is gold's use as money and as a medium of exchange. Gold is used extensively in the jewelry and coinage industries. Gold was the best known of all metals throughout history. It was widely used for currency. It was also used to make not only money but also all kinds of other products. For example, it was used in the form of deposits in the walls of buildings. Gold was the chief component of all forms of security, such as the numerous bars of gold that made up the contents of vaults and safes. The price of gold has increased very rapidly over the past 30 years. In January 1980, the price of gold was \$330 per troy ounce. It rose above \$1,000 per ounce in July 1980. By 1981, it hit a new high of \$1,920 per ounce. A year later, in 1982, it declined to \$900 per ounce, then rose again to \$1,200 per ounce in 1983. The price of gold began to rise again in 1984. It rose to a high of \$1,990 per ounce in 1986. Prices fell sharply in 1987, but then rose in 1988 and 1989. By 1991, gold prices had reached \$2,540 per ounce. Since 1990, the prices of gold have risen and fallen repeatedly. In fact, gold prices fluctuate so much that the short-term predictability of its price is almost nonexistent. Gold price moves can be attributed to a variety of factors. One cause is that the world's total gold reserves are declining. Each year, about 90 million troy ounces of gold
