

---

with a random name I have been using the helper in the current version of Craft for my site. `{% macro settings(settings) %} {% if craft.app.env == 'dev' %} Important: You must set the "systemConfig" property in the "Hooks" section of your craft/config/app.php file. {% else %} Important: You must set the "systemConfig" property in the "Hooks" section of your craft/config/app.php file. {% endif %} {{ settings|raw }} {% raw %} {% endmacro %}` I use this to "output" a block with the settings from the craft/config/app.php file. I was wondering if it is possible to get a the same effect using this in my Twig template file, like so: `{% if craft.app.env == 'dev' %} Important: You must set the "systemConfig" property in the "Hooks" section of your craft/config/app.php file. {% else %} Important: You must set the "systemConfig" property in the "Hooks" section of your craft/config/app.php file. {% endif %} {{ systemConfig }} {{ settings }} {% raw %} {% endraw %}` The issue I am having is that this does not seem to work. I am getting errors saying "Only variables can be passed by reference." 3ef4e8ef8d
