I am a very slow reader and a slow learner. The bigger book, the longer it takes for me to understand and retain the concepts and material. I am wondering what your approach to learning from books is. As a new kid on the block (I am in graduate school), I read a book and think that I've gotten all that I can out of the book. I then use what I've learned to do my research, and then as I start writing papers, I've got this nagging feeling that I've learned nothing, and I need to know more. So I go back to the book and read it again. Does this sound like a reasonable approach? I read an entire chapter and then it becomes harder to absorb the material because the information is swimming all over my brain, and I've read the book several times in my life. I have to really concentrate to understand the key concepts and try to put the pieces of the chapter together. I don't want to have this problem for years. It's really a shame because in terms of my passion for science, I would love to be a researcher. Can anyone tell me what they do? My approach to books may be askew. A: It's probably not enough to go back and read a chapter, especially if you're repeating material from memory. That doesn't give you much chance to learn from that material, especially since you can't really "see" it in your head in the way you can see a visual. You have to understand it, and you can't understand it in a meaningful way if you don't actively engage with [2d92ce491b](#)
