"); } return 0; } and //test2.cpp #include "test2.h" int main() { test2\_t t2; void \* ret = test2\_query(&t2); if(ret) { printf("test2\_query success! "); } return 0; } Then, I typed in test1.cpp and test2.cpp with gcc and g++ in Linux. Then I typed ./a.out and it showed: test1\_query success! test2\_query success! I typed ./a.out again ba244e880a
