Abhinetri 2 full. Q: Generalized gaussian distribution Recently I was told that a particular probability distribution is called the generalized Gaussian distribution, which is a generalization of the normal distribution. I was wondering how the parameters of the distribution are derived from the data. What is the derivation of parameters and is the method different for each different parameter of the distribution? A: Usually (unusually, in my opinion), the starting point is the (appropriately normalised) likelihood function. For example, the pdf of the normal distribution is (ignoring normalization factors): $p(x) = \frac{1}{\sqrt{2\pi\sigma^2}} \exp\left[-\frac{(x-\mu)^2}{2\sigma^2}\right]$ This is the functional

form of a bell-shaped curve. What is the functional form of the pdf of a bell-shaped curve? It's the product of the individual pdfs of x and $-x$ (which I've noted with parentheses). The pdf of $-x$ is the same as the pdf of x but the sign is flipped.

Because these pdfs are symmetric, the product is the same as twice the pdf of x alone. So we have: $p(x) =$

$$\frac{2}{\sqrt{2\pi\sigma^2}} \exp\left[$$

$$-\frac{(x-\mu)^2}{2\sigma^2}\right]$$

Can we derive a likelihood function for this kind of bell-shaped distribution? The exponential is symmetric about zero so we can assume that the mean is zero, and we can take the square root of the term

$$\frac{1}{\sqrt{2\pi\sigma^2}}$$
