The Imprint Ron Moore Improving productivity is a strategic and operational objective of any manufacturing enterprise. Designing and selecting manufacturing equipment to meet specific requirements can improve productivity. This book discusses how manufacturing equipment can be chosen to improve productivity. The book reviews the basic criteria for evaluating equipment and discusses the uses of various equipment. To help the reader in selecting a specific manufacturing process, the author suggests that an inventory of all the manufacturing processes should be created. Each manufacturing process should be given a number and the selected process should be entered into the inventory. By comparing the inventories of all manufacturing processes, the processes with the greatest productivity improvements are selected. The inventory system allows the user to evaluate equipment and choose the most productive process. The book also discusses the main causes of equipment failures in the manufacturing process. By reviewing the causes of equipment failures, the best practices in maintenance and preventive maintenance can be identified. A step-by-step process is presented for performing preventive maintenance. This book also discusses ways of measuring productivity. The discussion includes the various methods for measuring productivity, such as the output per worker and the output per unit of time. Additionally, the book includes the areas of process quality, raw materials quality, inspection quality, and equipment reliability. The book also considers the most cost-effective ways of reducing equipment downtime.
