One of the factors that play a critical role in determining the image quality of the device is the aperture (lens opening). A larger f-number (smaller aperture) lets in more light. However, this does not result in a brighter image. Using a larger lens opening increases the amount of light that strikes the image. However, this also decreases the amount of light that gets lost due to reflections. To minimize reflections, a lower f-number and a bigger lens opening is recommended. The maximum resolution of a single channel with a linear CCD camera is 2,048 pixels wide by 1,536 pixels tall. The resolution is reduced for each subsequent channel. In addition to the standard digital camera features, a zoom feature can be found on the rear of the camera. Like the viewing angle of the front digital camera, the zoom distance can be adjusted. The default is optimal for capturing the content of interest in full resolution. There are several settings for extreme zoom, including a digital zoom setting for a portion of the image to be magnified. In either case, this setting can be adjusted to any number, and is performed on the computer. A third option, an optical zoom, allows a lens with a longer focal length to be used. This decreases the amount of light that is necessary, and improves image clarity and detail. For users who wish to have the option of capturing the full screen, a Quick Capture feature can be found on the rear of the camera. The Quick Capture feature allows the camera to capture an entire screen, as opposed to a smaller region.1. Field of the Invention The present f3e1b3768c
