VisLog Crack+ With Registration Code Free

The program has a Windows interface and is compatible with Windows XP/Vista/7/8/8.1/10. Installation VisLog Activation Code is an application that addresses geoscience engineers involved in projects that require minute details about the image of the subsurface soil layers. The program enables these professionals to add and analyze borehole information, which can include ground water level, coordinates or depth of the layer, for instance. The utility can prove useful for projects where it is mandatory to visualize the boreholes in a site and displays them in 3D for both the water and ground surfaces. In this situation, the app can automatically draw the soil profiles for the selected boreholes based on the information imported from existing files or that you add manually. Another function of the program is to help create the topography of the construction site, as you can add various objects such as polygons, buildings and numerous other custom topography surfaces. In addition, you can employ the tool to envision the ground improvements to the site. Regardless of the preferred method of inputting the data, you should know that the 3D models can be generated in just a few seconds and hence, are going to be ready for future analysis. Each layer is exhibited with a distinct color shade and you can add as many as necessary, based on the specifications of the geographic region of the construction site. The application can be used to visualize an object (Point, Line, Polygon) in 3D without any difficulties, this is achievable using the Macro Descriptions. The software can instantly turn any object into a 3D model, which is very easy for the user to manipulate. The procedure of creating a new object for the 3D modeling application is quite easy: 1. Select the option of "3D - Create Object" and you can choose from the 2 options of the generated objects (Line/Polygon/Point) 2. You can add as many lines as you want using the + key and adjust the number of segments and the color of the lines 3. You can zoom in/out by using the mouse wheel 4. Click and drag the lines using the right button of the mouse and adjust the shape and the length of the lines 5. Press "OK" to add the lines to the object 6. You can create points using the "+ key" 7. You can also resize the points using the right button of the mouse 8. You can create custom coordinates for points using the "Enter" key 9. You can add more custom

coordinates using the "Enter" key 10. You can define the name of the object using the "Enter" key 11. You can create a text on the line using the "Type" option and enter the details using the "Enter" key 12. You can select the color of the object using the "Color" option 13. You can select the size of the line using the "Width" option 14. You can adjust the shape of the line using the "Width" option 15. You can select the color of the line using the "Width" option 16. You can select the color of the object using the "Color" option 17. You can select the size of the object using the "Width" option 18. You can select the color of the object using the "Color" option 19. You can select the color of the object using the "Color" option 20. You can select the size of the object using the "Width" option 21. You can select the color of the object using the "Color" option 22. You can select the size of the object using the "Width" option 23. You can select the color of the object using the "Color" option 24. VisLog Free [Latest 2022]

VISLOG is a program that is designed to be able to assist individuals or engineering firms in the development of construction projects. In addition to a geological mapping, the program also allows creation of a virtual 3D model of the location of a particular borehole, as well as the topography of the construction site and its objects. The program is able to also generate 3D models based on the information that has already been imported from the project's original files and can either be placed on top of a manually drawn map or you can opt for automatically generated borehole. All of these models are able to visualize the image of the subsurface soil layers, thus providing better insight about the geology of the site. The app is able to provide exact details about the height of the layers and the exact level or depth of the boreholes, as well as the water level in the subsoil. In addition, the program allows easy and quick access to a myriad of maps, which can help in developing the most effective way to tackle the construction process. When it comes to visualizing the topography of the construction site, the program also can create the geography of the location, as you can easily add the surface of any desired object and even add the terrain around the construction site, if you so desire. Another function of the app is to allow you to generate the topography of the construction site, which can be exhibited in a number of ways, as the user can choose between line, section or elevation surfaces. As a consequence of this, you can easily access the relative location of the boreholes on the site and examine their position in the 3D models. When the data about the soil layers, boreholes or the location of the construction site are updated in the project files, VISLOG is capable of automatically updating the 3D models in the same location. The program is also capable of including the selected objects on the models, which have been added manually. VisLog Features: Generates 3D models based on the imported and existing borehole or ground profile data. Generates 3D models of the construction site. Imports the previously created models from the project. Makes it possible to add and delete objects and layers, as you can add the ground surface of objects such as buildings and roads, as well as topography surfaces such as lines, sections and elevations. Generates information about the height of the soil layers and the location of

What's New in the?

This is a full featured version of a program created for the Bureau of Topography's Geospatial Earth Observation program of excellence, the NEEP. This version contains enhancements, bug fixes and new features to meet the needs of a more comprehensive workflow that can be applied to data collected from aerial and ground-based LIDAR. This program generates an orthorectified model for the entire continental US, Alaska, Hawaii, and Puerto Rico. Komputeal is a free easy to use utility which is used to convert DWG files to BMP, JPG, GIF, TIF, PNG and even TIFF files with ease. The app also has a built-in batch conversion feature that permits the user to change or convert multiple files at one time. The conversion results are accurate, and they are as sharp as if they were imported directly from the source application. Description: It is an easy to use converter and a very powerful file viewer that is used to convert, convert and edit images. It supports the most popular image formats, such as BMP, JPEG, GIF, TIFF, PNG, PCX, JPG, PSD, PICT, ICO, PCD, EMF, and many more. Besides, you can add text and create a web site-like "gallery" with a preview of each image, for a quick and easy image display and management. The program is a perfect tool for quick and easy conversion of images, along with image editing. The output files generated by the app are accurate and will open in most major image viewers. It can also extract, resize, rotate and adjust the brightness, contrast and color saturation of an image. Airbus Intermap is an excellent 3D terrain modeling software. It can be used to create a terrain from aerial photos and other sources of aerial images. Besides, it has many advanced rendering features like point cloud or a display, a contour line. Description: Airbus Intermap is an advanced 3D terrain modeling software. It can be used to create a terrain from aerial photos and other sources of aerial images. Besides, it has many advanced rendering features like point cloud or a display, a contour line, and a comparison between two points. The program can create a virtually unlimited number of objects such as mountains, hills, rivers, lakes, etc. The most interesting fact about the app is that it can generate more than 1,000 individual topographical layers based on specific parameters such as elevation, or slope angle. These parameters can be used to map out elevation zones, so to create a topographical map of any number of objects on a specific surface. It is like a virtual 3D map, that you can control at any time. It is a multi-threaded app, so, the work can be done with multiple threads and files, and it can monitor
