ELECTRC 2014 NEC Calculator is a most comprehensive program for quick and accurate electrical calculations. It can be employed for calculating the wire sizes of any electrical device, based on their usage, and to determine the power of motors and other electrical devices. Electrical calculations can be used to determine power factor, fault current, voltage drop and other electrical parameters. A comprehensive solution for most common electrical calculations With 12 modules, containing 12 calculators, ELECTRC 2014 NEC Calculator can calculate these parameters and many more. Each calculator is updated with the latest standards and can be used to calculate the size of the wires and wires that can be used for different kinds of electrical devices. The application includes several units for using different references such as the circuit calculation reference, the conductor calculation reference and the overload calculation reference. There is also a unified reference, which contains the circuits and references present in the other units. Each unit has its own entry and reference table. These entry tables are updated as and when the reference is revised, and every calculator in the program has its own customization options. The application allows one to save results for later use. It also includes a reference table which one can use to calculate values for various parameters.
