(I mean the rev limiter, not the maximum power output.) There are some cars out there that have 2000-3000 rpm redline but very low maximum power output, like that kind of vehicles. Is there a limit to the amount of watts that the engine can put out? Why are these limitations being set? A: There is a limit to the torque that can be transmitted to the drive-train, depending on your transmission. When I was younger, I worked in the engine manufacturing industry. At one company, they developed a hydraulic system to replace all of the valves on the head of the engine. This required quite a bit of development, which is a costly process. They wanted to save money, as they were having a hard time on the business side, and they wanted to maximize the life of the engine. When they finished developing the hydraulic system, they tested it out. They had an idea of the torque they wanted to output on the drive-train, and when they had that torque, the valves would open and close, resulting in the flow of oil to the drive-train. The valves would have an open and closed position, but there was no torque being output from the head. The valves would be open on a specific cycle, resulting in a specific amount of torque being output. This particular system had a very difficult to predict amount of torque, as it was working with valves on a cylinder head and how they would react to the flow of oil. Because this system was so new and involved hydraulics, they couldn't even use any kind of real-time monitoring. They had to set up a test rig to test it out, and it was not cost effective.
