Analysis of Free Thyroxine (FT4) in Ectopic Thyroid Gland Associated with Thyroid Eye Disease: Correlation with the Thyroid Stimulating Hormone (TSH) Level. Free thyroxine (FT4) measurement is a valid diagnostic tool for thyroid disease. We measured FT4 using equilibrium dialysis and compared the FT4/TSH ratio and the FT4 concentration between the normal and ectopic thyroid

tissues, which may be associated with Thyroid eye disease (TED). The ratio of the FT4 to TSH level was also investigated in TED patients to determine if there is any correlation between the thyroid condition and the FT4/TSH ratio. The FT4 concentration was measured using equilibrium dialysis and the FT4/TSH ratio was calculated by dividing the FT4 concentration by the TSH concentration. A wide range of thyroid hormones can be measured using equilibrium dialysis. We compared the FT4 concentration using equilibrium dialysis with the level determined by RIA, and the FT4/TSH ratio using

equilibrium dialysis was also determined. We then compared the thyroid condition and FT4/TSH ratio between TED patients and those of a control group. We also investigated the effects of macular dystrophy on the FT4/TSH ratio. The plasma FT4 concentrations measured using equilibrium dialysis were significantly lower than those determined using RIA in TED patients (P
