"SmokeTest" is a Microsoft.NET assembly that provides a method of reflective testing of an API, an application's public interfaces..NET SmokeTest can be used to determine whether a given application is interacting with the specified assembly. .net SmokeTest Features: - Visualize the results by treeview, debug window, or grid. - Visualize the results by treeview, debug window, or grid. .net SmokeTest is a simple helper tool to help you test.net applications. It provide a convenient way to fully instrument assembly or dynamically extract application domain information. After that, you can check or control any reflection data by visualizing them in the screen. Send2u is a DNS server designed to answer recursive queries. It can also be used as a forwarding server. Both IMAP and POPS3 are supported, including individual POP3 and IMAP sessions. Balsamiq Mockup is a feature-rich, inexpensive and easy-to-use tool for designing mockups and prototypes, featuring an intuitive interface and a highly collaborative process. With Balsamiq, no Adobe, Visio, or Web Site Design software is needed, so you can start creating mockups right now. The Simple Network Management Protocol (SNMP) Agent is a software daemon designed to monitor, manage, debug, and perform configuration of the network in an IBM or compatible network operating system. SNMP Agent is a client/server protocol that allows you to view and manage TCP/IP devices, such as printers, modems, sensors, disk drives, and more. The SNMP Agent's MIB provides functions that are independent of the operating system and use the SNMP to access and manage devices on the network. The SNMP Agent provides a SNMP manager (SNMPMan) and a SNMP agent (SNMPAgent) to view, debug and manage network devices. The Java SDK is an open source software development kit (SDK) for the Java platform. It provides a range of development tools and libraries for developers to create Java-based applications. This package contains the Java Runtime Environment (JRE), which is a means by which Java applications can run. This tool is a pre-requisite for development and also for running Java applications. This project presents a way to understand and modify the effects of sample-to-population ratios on the reproducibility of regression analyses. Single-Sample Analysis (SSA) offers a

Create a smoke test with the.net reflector. The tool takes a.NET Assembly as a "target". You can test this assembly for any.net classes or methods that are not marked as internal or private. The script then runs the assembly in debug mode, which lets you step through the.NET code. All information about the code including IL metadata is recorded and can be accessed via a GUI. .net SmokeTest is written in.net. It is not installable. .net SmokeTest comes in two parts: .net SmokeTest.exe A utility application that runs the assembly under.net debug. .net SmokeTestGUI .net SmokeTestGUI is a standalone GUI that runs in the background and lets you interact with the assembly and settings. Use SmokeTest to quickly perform smoke testing on any.net assembly, regardless of which version of.net you are running. What's New In .net SmokeTest?

SmokeTest is a simple.net utility that allows you to view, set or get any property or field of any class. It is useful for a couple of reasons: 1. Developers can often overlook checking the output of reflection calls to ensure the method or property they are using is working correctly. 2. Testing takes forever to run. If you have a method that looks just like another similar method you're pretty much guaranteed to fail as the two methods are really similar. SmokeTest allows you to minimize this time by quickly checking that the properties and fields are set or not set the same as another method. .net SmokeTest Features: 1. View any property or field within any.net assembly. 2. Set any property or field within any.net assembly. 3. Get any property or field within any.net assembly. 4. Drill-down into the results showing exact set or get values, or if the property or field is not set/getted. 5. Show how the class will appear in detail in the browser. 6. Automatically detects property or field name changes when the property or field name changes. .net SmokeTest Tips: 1. Paste the following in your IDE when testing the API: using System; using System.Reflection; using System.Collections.Generic; namespace smoketest { public static class MyReflection { public static void Main (string[] args) { } public static List myList = new List (); public static MyClass.MyClass() { } public static void setMyList() { } public static string getMyList() { return "" ; } public static void myDrillDown() { } public static bool isSomePropertySet(string str) { } public static bool isSomePropertyNotSet(string str) { } } } 2. Set the myList property in the Main method. If the myList property is set and called you'll get this output: SmokeTest: Checking IsMyListSet SmokeTest: Checking myList == "x" SmokeTest: Checking myList == "y" SmokeTest: Checking myList == "z" SmokeTest: Checking IsMyListSet SmokeTest: Checking myList == "z" Version ====== smoket
