The USB Descriptor Dumper is a very useful Windows utility that is capable of providing detailed information about the contents of any USB device on the computer. When run, the Descriptor Dumper displays the contents of any device (aka "external storage") mounted in the system. The program is supplied with tools to quickly parse and retrieve information from the USB Descriptor and display it on the screen. There are tools available to query, filter, and search any USB Descriptor. The tools available to you may vary from searching based on the size of the USB Descriptor (for example, filtering on whether the descriptor is 512 bytes, 1024 bytes, 2048 bytes, etc.) to searching for a specific keyword within the descriptor. The program also includes an application called the USB Receiver that can be used to interact with a USB device and view and modify the contents of the Descriptor. The USB Receiver is designed to provide a quick way for you to copy and past data from the USB device, display the data on the screen, save it to an email, and more. The USB Receiver is designed to run a real time mode, with no need for a window to be open. The USB Descriptor Dumper does not require additional software to run. It is designed to run on a PC and display the contents of any USB device on the PC's USB Bus. The program is supplied with the tools to parse and search any USB Descriptor and as such, there is no software to install. The USB Descriptor Dumper operates much like a "scanner" but is capable of displaying the contents of any USB device. This capability is useful in situations where you have a new device in your PC that you want to check the contents of but you may not know what device it is or what should be on its USB Descriptor. From the program interface (as an example of a typical screen the program runs with): Search by Device ID: The device ID of the device is displayed along with the contents of the descriptor. Search by Vendor ID: The vendor ID of the device is displayed along with the contents of the descriptor. Search by Product ID: The product ID of the device is displayed along with the contents of the descriptor. Search by Attributes: The attributes of the device are displayed along with the contents of the descriptor. Display the contents of the descriptor: The contents of the descriptor is displayed in a readable format and data can

The USB Descriptor Dumper is a Windows utility that displays the USB descriptors of any USB device in plain text format. This includes the Vendor ID, Device ID, Product ID, Manufacturer String, Product String, Serial Number and other info that would otherwise be stored in the registry (if the usb device supports it). It also gives you the ability to copy or paste the information into a.txt file or into an email. It stores the dumper text to a file so it's easy to view the descriptors of any USB devices when needed. However, you will need to run the dumper in a separate console window. It should be noted that the dumper will only read out the USB descriptors that are defined in the drivers INF file, so if you have modified the hardware (as some third-party manufacturers do) you won't be able to dump the device info. Sample Results (as of December 2014): Descriptors can be accessed from any USB-based device (keyboard, mouse, printer, smart card reader, USB modem, etc.) or any USB host. However, if you are interested in this type of device, an attached mouse is probably the most convenient device to use. Why would you use it? Back in the day, we used to dump the USB descriptors by using a configuration tool such as ConfigureIT in the WinPE environment of the PC. Since we are all geared towards automation nowadays, I thought I'd create a GUI tool that will work with the USB descriptors. While this is one of the more useful features on a PC (with the help of USB Descriptor Dumper), it does have a few limitations. First of all, it only works with Windows 2000 to Windows 8 (both 32bit and 64bit) and Windows ME. Another limitation is that it works with the device that initiates the process, rather than the one the dumper itself runs on. For example, you might have a dumper running in a PC where USB Descriptor Dumper is plugged into a different USB port. In this case, you'd need to have the dumper application send the USB descriptor dump to the PC where USB Descriptor Dumper is installed, so you'd be able to copy and paste it to a text document or email. How does it work? An USB device has a series of descriptors that are embedded in its device description and in the INF file of the device driver. It's all implemented

Cyber-Mobility is the claim that your computing devices are just as mobile as your physical luggage. More so than most of us realize. While Cyber-Mobility has been around for decades, there are few broad movement around it, and it's not something that has gained traction as a mainstream concept. But it is a particularly important issue with the rapid growth of the Internet of Things. Cylance Software Corp. has submitted its CyberMobility Centers of Excellence (CoE) report to the Cylance United States Headquarters in Santa Clara, CA. The report highlights the top three security professionals by seniority in relation to the term CyberMobility, and then details their personal successes and insights gained during CyberMobility. On a daily basis, the number of threats to cyberspace grow, supported by cyber criminals that are looking for victims where cybercrime is most prevalent. In particular, the methods that criminals are using are constantly changing. Malware, exploits, ransomware, and other types of attacks or threats to data breach are all growing, and are becoming more complex as well. Despite this, individuals need to be in a continuous defensive mode, monitoring their devices, and engaging in security. CyberMobility Centers of Excellence at the Cylance United States Headquarters in Santa Clara, CA have developed a solution for individuals and organizations that help to keep threat aware, CyberMobility-enabled individuals working from anywhere at all times. Richard S.
